Chapter 1: Breast Milk Consumption And Its Effects On Child Health
Pediatrics Laboratory And Clinical Research

Breast milk - Wikipedia

Breast milk or mother's milk is milk produced by mammary glands, located in the breast of a human female. Breast milk contains bioactive agents that can modify the functions of the gastrointestinal (GI) tract, and may have beneficial effects on the systemic PDF.

Milk Consumption in Preterm Neonates and Cardiac Shape

We hypothesized that being fed human breast milk during early postnatal life is beneficial to long-term cardiac structure and function in preterm-born infants.

METHODS: A total of 926 preterm-born infants originally took part in a randomized controlled trial evaluating the effects of increased consumption of fluid in preterm-born infants. The study randomly assigned the infants to receive either breast-feeding or formula-feeding during the first 7 days of life. The primary outcomes were the cardiac structure and function parameters measured using echocardiography.

RESULTS: The infants who received breast-feeding had significantly lower cardiac output and cardiac index compared to those who received formula-feeding. In addition, the infants who received breast-feeding had a lower incidence of heart failure during the first 7 days of life.

CONCLUSIONS: These findings suggest that breast-feeding may have beneficial effects on cardiac structure and function in preterm-born infants.

Epigenetic Effects of Human Breast Milk

Human breast milk is well-known for its ability to prevent and treat several acute and chronic diseases. Indeed, breastfed children may have lower risk of developing certain diseases later in life. This paper discusses about presumed epigenetic effects of human breast milk on cardiovascular health and early cardiovascular development in premature infants.

Published in JAMA Network Open, the study of 80 preterm infants is the first of its kind to show that preterm infants with higher exposure to human breast milk have lower risk of developing certain diseases later in life. The study also suggests that human breast milk proteins in breast milk break down into peptides that can mimic opiate-like drug effects; this helps bond child to mother, but may cause Sudden infant death syndrome (SIDS) in some cases.

Vitamin B12 deficiency is appropriate for certain people. Consumption of breast milk, formula and other milk products in breast milk is recommended for certain people. A new study published in the journal of NutritionFacts demonstrates the beneficial effects of human breast milk consumption on cardiovascular health and early cardiovascular development in premature infants.
